

A Hypothetical Library

Reasons for the nomination:

This student has the ambition to accomplish anything. His project for an urban monastery was based upon the ACSA program for a library of the future, taking the form of a towering monument to the printed work.

This project comes from our upper division digital studio, where students make heavy use of digital modeling, rendering, animation, simulation and web tools. The project's form was initially derived through a series of simulation exercises. The development of the model into a believable building was accomplished with **form•Z**. The studio is ten weeks long.

The detail of development in this student's design for the archive structure is visible in his purposeful and meticulous **form•Z** derived models. Jason's abilities in modeling, rendering, and animation are probably well beyond the reach of all but the very experienced or a team.

Honorable Mention
